Input/Output

- For input we have input()
- For output we have print()

input() function :-

- In python programs, we use the input() function to take any kind of data input from the user through the keyboard.
- The input() function waits for the user's input and as soon as the user enters the data and press the enter key, the input() function reads that data and assigns it to the variable.
- Syntax :- var_name = input()
- input() function always return string value.

print() function :-

- It is used to display the output on the console

Comments

- Single-Line - #LOC
- Multi-Line – '''LOCs''' or """LOCs"""
